

AMENDMENTS TO THE CLAIMS

Please amend the claims as follows:

Claim 1. (Previously Presented)

A flying object navigation system comprising:

a base station capable of storing information provided as common information for navigation of at least one flying object existing as a navigation object, said base station transmitting to said flying object necessary data from said stored information for determining a course of action to be taken by said flying object, on the basis of observation data from meteorological observation means for observing the meteorology of a space region in which said flying object is flying, said base station transmitting said necessary data by using communication means connected to said flying object,

wherein said base station has a memory for storing data sets comprising:

all observation data obtained in the past through observation by said meteorological observation means;

records of courses of action taken by said flying object on the basis of the observation data; and

records of events encountered by said flying object as a result of the records of the courses of action

wherein the course of action taken by said flying object is determined based on a prediction result, the prediction result being based on the observation data obtained, the records of courses of action taken by prior flying objects

encountering the same observation data, and the records of events encountered, which are stored as data sets in the memory of the base station.

Claim 2. (Previously Presented)

The flying object navigation system according to claim 1, wherein said flying object, having said meteorological observation means, further includes:

transmitting means for transmitting, to said base station, observation data obtained through observation by said meteorological observation means; and

receiving means for receiving necessary data for determining a course of action to be taken, the necessary data being transmitted from said base station by using said communication means.

Claim 3. (Cancelled)

4. (Previously Presented)

The flying object navigation system according to claim 1, wherein said base station includes a data base which is constructed on the basis of the contents of said data sets stored in said memory and wherein observation data obtained through observation by said meteorological observation means, a course of action taken by said flying object after meteorological observation, and an event

encountered by said flying object as a result of taking the course of action are related to each other.

Claim 5. (Previously Presented)

The flying object navigation system according to claim 4, wherein said base station comprises:

a receiving section for receiving, through said communication means, observation data obtained through observation by said meteorological observation means;

a prediction section for predicting the relationship between a course of action taken by said flying object and an event encountered by said flying object as a result of taking the course of action by making a search to ascertain which case in said data base the received observation data corresponds to; and

a transmitting section for transmitting a prediction result obtained by said prediction section to said flying object through said communication means.

Claim 6. (Previously Presented)

The flying object navigation system according to claim 5, wherein said base station has a function of successively storing, when data sets are newly formed, the new data sets on said memory, and a function of reconstructing said data base from the older data sets and the new data sets successively stored.

Claim 7. (Currently Amended)

A flying object navigation system comprising:

a base station capable of storing information provided as common information for navigation of at least one flying object existing as a navigation object, said base station transmitting to said flying object necessary data from said information for determining a course of action to be taken by said flying object, on the basis of observation data from meteorological observation means for observing the meteorology of a space region in which said flying object is flying, said base station transmitting said necessary data by using communication means connected to said flying object, and

wherein said base station transmits a signal for operating said flying object to remotely control the operation of said flying object based on the determined course of action.

Claim 8. (Previously Presented)

The flying object navigation system according to claim 1, wherein said system is provided on each of a plurality of different stars, and said base station that is respectively provided on the stars are connected by base station interconnection communication means.

Claim 9. (Previously Presented)

The flying object navigation system according to claim 1, wherein said

system is provided on each of a plurality of different stars, a central base station is provided among the plurality of stars, and said base station that is respectively provided on the stars are connected to each other through said central base station.

Claim 10. (Previously Presented)

The flying object navigation system according to claim 1, wherein a plurality of base stations are provided on one star.

Claim 11. (Previously Presented)

The flying object navigation system according to claim 10, wherein the plurality of said base stations provided on each star are connected to each other through base station interconnection communication means, and wherein every time a data base is reconstructed, data sets and the data base are transmitted between said base stations.

Claim 12. (Previously Presented)

The flying object navigation system according to claim 1, wherein said base station and said flying object has an antenna, and each of said communication means and said base station interconnection communication means performs wireless communication.

Claim 13. (Previously Presented)

The flying object navigation system according to claim 1, wherein said flying object is an airplane.

Claim 14. (Previously Presented)

The flying object navigation system according to claim 1, wherein said meteorological observation means comprises an air turbulence observation apparatus.

Claim 15. (Previously Presented)

The flying object navigation system according to claim 1, wherein an event encountered by said flying object includes changes in wind velocity with time in vertical and/or horizontal directions acting on said flying object.

Claim 16. (Previously Presented)

The flying object navigation system according to claim 12, wherein said communication means for performing wireless communication uses light waves.

Claim 17. (Previously Presented) The flying object navigation system according to claim 12, wherein a plurality of base stations are provided on one star and are connected by a base station interconnection cable.

Claim 18. (Previously Presented)

The flying object navigation system according to claim 17, wherein said base station interconnection cable is formed of an optical fiber cable.

Claim 19. (Previously Presented)

The flying object navigation system according to claim 14, wherein said air turbulence detector comprises a laser radar air turbulence detector.

Claim 20. (Previously Presented)

The flying object navigation system according to claim 19, wherein said laser radar air turbulence detector has functions of transmitting laser light, receiving, as a received signal, scattered light caused by scattering of the laser light in the air, and observing the wind velocity from the Doppler effect in the received signal.

Claim 21. (Previously Presented)

The flying object navigation system according to claim 19, wherein said laser radar air turbulence detector has functions of transmitting laser light, receiving, as a received signal, scattered light caused by scattering of the laser light in the air, and observing the density of air from the intensity of the received signal.

Claim 22. (Currently Amended)

A flying object having a navigation system comprising:

meteorological observation means for observing the meteorology of a space region in which said flying object is flying; and

flying object interconnection provided in said flying objects means for interconnecting directly with a plurality of flying objects,

wherein information provided as common information for navigation of said flying objects is stored in each of said flying objects, and a course of action to be taken by each of said flying objects is determined on the basis of said information and observation data from said meteorological observation means.

Claim 23. (Previously Presented)

The flying object having a navigation system according to claim 22, wherein said meteorological observation means is mounted on said flying object.

Claim 24. (Previously Presented)

The flying object having a navigation system according to claim 23, wherein said flying object has a memory for storing:

data sets constituted of all observation data obtained in the past through observation by said meteorological observation means mounted on said at least one flying object;

records of courses of action taken by said flying object on the basis of the observation data; and

records of events encountered by said flying object as a result of the records of the courses of action.

Claim 25. (Previously Presented)

The flying object having a navigation system according to claim 24, wherein said flying object further comprises:

a data base which is constructed on the basis of the contents of said data sets stored on said memory, and wherein observation data obtained through observation by said meteorological observation means, a course of action taken by said flying object after meteorological observation, and an event encountered by said flying object as a result of taking the course of action are related to each other.

Claim 26. (Previously Presented)

The flying object having a navigation system according to claim 25, wherein said flying object further comprises:

a prediction section for predicting the relationship between a course of action taken by said flying object and an event encountered by said flying object as a result of taking the course of action by making a search to ascertain which case in said data base the received observation data obtained through observation by said meteorological observation means corresponds to; and

a transmitting section for transmitting a prediction result obtained by said prediction section to another flying object through said flying object interconnection communication means.

Claim 27. (Previously Presented)

The flying object having a navigation system according to claim 26, wherein said flying object includes a function of successively storing on said memory data sets, each of said memory data sets comprising:

observation data obtained through observation by said meteorological observation means mounted on said flying object or another flying object;

a record of a course of action taken by said flying object or the other flying object on the basis of the observation data;

an event actually encountered by said flying object or the other flying object as a result of the record of the course of action; and

a function of reconstructing said data base from updated data sets obtained by combining the older data sets and the new data sets successively stored.

Claim 28. (Previously Presented)

The flying object having a navigation system according to claim 22, wherein said system is provided on each of a plurality of different stars, and said flying objects, flying respectively near the stars, are connected by said flying object interconnection communication means.

Claim 29. (Previously Presented)

The flying object having a navigation system according to claim 22, wherein said system is provided on each of a plurality of different stars, wherein a central base station is provided among the plurality of stars, and wherein said flying objects flying respectively near the stars are connected to each other through said central base station.

Claim 30. (Presently Presented)

The flying object having a navigation system according to claim 22, wherein said flying object has an antenna, and said flying object interconnection communication means performs wireless communication.

Claim 31. (Previously Presented)

The flying object having a navigation system according to claim 22, wherein said flying object is an airplane.

Claim 32. (Previously Presented)

The flying object having a navigation system according to claim 22, wherein said meteorological observation means comprises an air turbulence observation apparatus.

Claim 33. (Previously Presented)

The flying object having a navigation system according to claim 32, wherein an event encountered by said flying object includes changes in wind velocity with time in vertical and horizontal directions acting on said flying object.

Claim 34. (Previously Presented)

The flying object having a navigation system according to claim 32, wherein said flying object interconnection communication means for performing wireless communication uses light waves.

Claim 35. (Previously Presented)

The flying object having a navigation system according to claim 32, wherein said air turbulence detector comprises a laser radar air turbulence detector.

Claim 36. (Previously Presented)

The flying object having a navigation system according to claim 35, wherein said laser radar air turbulence detector has functions of transmitting laser light, receiving, as a received signal, scattered light caused by scattering of the laser light in the air, and observing the wind velocity from the Doppler effect in the received signal.

Claim 37. (Previously Presented)

The flying object having a navigation system according to claim 35, wherein said laser radar air turbulence detector has functions of transmitting laser light, receiving, as a received signal, scattered light caused by scattering of the laser light in the air, and observing the density of air from the intensity of the received signal.

Claim 38. (Currently Amended)

A flying object navigation and prediction system comprising:

an observation apparatus mounted on a flying object for collecting and transmitting observation data; and

a database terminal coupled to said observation apparatus for receiving said observation data, determining and transmitting prediction results to said flying object for determining a flight path for said flying object based on said prediction results,

wherein observation data is received by said database terminal directly from a plurality of flying objects, and

wherein said database terminal determines said prediction results based on received observation data and prior observation data from said plurality of flying objects, said observation data received from said plurality of flying objects being categorized in said database terminal according to occurred events in similar trajectories and spatial positions.

Claim 39. (Previously Presented)

The flying object navigation and prediction system according to claim 38, wherein said observation data includes meteorological data.

Claim 40. (Currently Amended)

A flying object navigation and prediction system comprising:

an observation apparatus mounted on at least one flying object for collecting and transmitting observation data; and

a database terminal mounted on a second flying object for receiving said observation data, determining and transmitting prediction results for determining a flight path for said second flying object based on said prediction results,

wherein said database terminal determines said prediction results based on directly received observation data and prior observation data from said at least one flying object, said observation data being categorized in said database terminal according to occurred events in similar trajectories and spatial positions.

Claim 41. (Previously Presented)

The flying object navigation and prediction system according to claim 40, wherein said observation data includes meteorological data.
